CLASSIC TEMPLATE

author: Daniel Buca
date: April 2012

Template description:
CLASSIC is a simple template, used to demonstrate the functionality of the 2PCMS script.

1. About the template engine
2. Folders
3. File descriptions

1. About the template engine
The template engine used in 2PCMS has the sole role of separating the code from the html.
The scripting language used in the template files is PHP.

2. Folders
Templates are stored in the /templates folder.
For each template there is a folder. The folder name is the template name.

The template folder will hold only template specific files.

3. File descriptions
footer.php - contains the html code for the footer section

header.php - contains the html code for the header section, the left sidebar, untill the breadcrumbs and page h1 (including)
The left sidebar is included in the header.php template file. The sidebar has both mandatory blocks (categories, brands) and optional blocks (articles, article categories, landing pages) that can be enabled/disabled from the settings menu in the admin section.

index.php - contains the html code for the index page

listing.php - contains the html code for the listing page

listing-pagination.php - contains the pagination display; it is used before and after listing.php and search.php template

product.php - contains the html code for the product page, both the product description and the related products section
The product page also contains partner (shop) information and/or articles listing (for related articles).

search.php - contains the html code for the listing elements used in the search results page

style.css - css file, contains all theme css, there is no default script css

article.php – contains the html code for the article page, one article details page plus listing of related products.

article_category.php – contains the html code for the article category page, listing all articles in one category, no pagination

landing-page.php – contains the html code for the landing page, one custom made product description and related products

Info about the social icons:
Considering this is a script functionality and not a template functionality the social icons can be found in the /images folder and not in the template folder.
